

YR6 Knowledge Organiser - Geometry

Key Concepts

- Recognise, describe and build simple 3D shapes, including making nets
- Compare and classify geometric shapes based on their properties and sizes
- Find unknown angles in any triangles, quadrilaterals and regular polygons
- Recognise angles where they meet at a point, are on a straight line, or are vertically opposite and find missing angles

Key Vocabulary

- 2D / 3D shapes
- nets
- acute / right / obtuse / reflex angle
- vertically opposite angle
- protractor
- compass
- triangle
- quadrilateral
- polygon

3D Shapes

We can apply our knowledge of 3D shapes to recognise and describe their properties, including with everyday objects.

"The cereal box is a cuboid as it has 6 rectangular faces, 12 edges and 8 vertices. The tin of beans is a cylinder as it has 2 flat faces and 1 curved surface."

Making Nets

Nets are 2D figures that can be folded to make 3D shapes.

cuboid

cylinder

square-based pyramid

There can be several possible nets for one 3D shape. For example, all of the nets below could be folded to make a cube.

Comparing and Classifying Shapes

We can compare and classify geometric shapes based on their properties, such as:

- regular / irregular
- number of parallel or perpendicular sides
- size of angles

Find Unknown Angles in Triangles

The interior angles of a triangle total 180° . We can use this fact to calculate missing angles.

$$180^\circ - (78^\circ + 66^\circ) = 36^\circ$$

$$a = 36^\circ$$

YR6 Knowledge Organiser - Geometry

We use hatch marks to show equal side lengths. Recognising the equal lengths helps us to identify the equal angles in isosceles triangles.

$$a = 63^\circ$$

$$b = 180^\circ - (63^\circ + 63^\circ) = 54^\circ$$

Find Unknown Angles in Quadrilaterals

The interior angles of a triangle total 360° . We can use this fact to calculate missing angles.

$$a = 360^\circ - (108^\circ + 84^\circ + 74^\circ) = 94^\circ$$

As with triangles, we can use our knowledge of the properties of shapes, such as parallel lines, to identify the equal angles in quadrilaterals.

$$b = 72^\circ$$

$$360^\circ - (72^\circ + 72^\circ) = 216^\circ$$

$$a = c = 216^\circ \div 2 = 108^\circ$$

Find Interior Angles in Regular Polygons

We can use our knowledge of the interior angles

in a triangle to calculate the sum of the interior angles of a regular polygon.

We can partition shapes into triangles from a single vertex, then multiply the number of triangles by 180° to find the sum of their interior angles.

$$180^\circ \times 3 = 540^\circ$$

The interior angles of a pentagon total 540° .

$$180^\circ \times 4 = 720^\circ$$

The interior angles of a hexagon total 720° .

"The number of triangles increases by 1 for each extra side. This means a heptagon can be split into 5 triangles. The sum of its interior angles is $180^\circ \times 5 = 900^\circ$ "

Angles on a Straight Line

Angles on a straight line have a sum of 180° .

$$\text{The missing angle} = 180^\circ - 124^\circ = 56^\circ$$

Angles around a Point

Angles around a point have a sum of 360° .

$$\text{The missing angle} = 360^\circ - (113^\circ + 49^\circ) = 198^\circ$$

Vertically Opposite Angles

Angles on straight lines must have a sum of 180° and opposite angles are equal on two straight lines that cross.

$$a = 81^\circ$$

$$b = 180^\circ - 81^\circ = 99^\circ$$

$$c = 99^\circ$$
